Fluid mechanics Fluid mechanics is a branch of mechanics. The field of fluid mechanics combines the usual subjects of physics, namely mechanics, thermodynamics, and heat transfer, with the peculiar properties and behavior of fluids, like liquids and gases. The term fluid mechanics is often used synonymously with hydrodynamics, which is the study of the flow of fluids. Fluid mechanics Fluid mechanics is the study of the flow of fluids, including liquids, gases, and any composite media. Pockets of gaseous conditions There exist pockets of gaseous conditions within the Earth, for example within the Earth's atmosphere, within the interior of the Earth, and within the human body. Some of these pockets have very high pressures or temperatures. These pockets of gas are confined spaces. The meaning of the term pocket is usually applied to high-pressure pockets, which often form as a result of explosive events. Gas and fluids are two kinds of fluids. However, they are regarded as different in gas hydrodynamics because pressure equilibrium does not exist in gas. In addition to the dynamics and motion of gas, the gas pressure can influence the fluid motion; usually, the pressure is lower than the force exerted by particles to move fluid into motion. Some gas pockets are isolated pockets of relatively high or low pressure. They may be enclosed by impermeable walls, or porous, to a varying degree of permeability. The liquid form of gas can flow as a fluid, or as a gas. Internal pressurization of the Earth's mantle Pressure, temperature, and density are three physical quantities that are usually associated with each other. An example of a material whose pressure is elevated or reduced is the solidification of liquids, such as is shown by the solidification of water. The mantle of the Earth is a layer of the Earth that is located between the solid crust and the liquid core, the outer core. It contains 85 percent of the Earth's volume and is the hottest region of the Earth. It is made of basalt
