codebf dcm. A new analysis of the
relationship between divorce and
obesity levels in the United States
reveals that women who divorce
are 2.1 times more likely to be
obese than women who are
married. The obesity rates of men
who divorced in the last year have
also increased, but not by as much
as that of women. Obesity and
divorce Previous research has

shown that divorce is associated with an increased risk of depression and anxiety and a decreased risk of physical activity. Now, researchers from the University of Queensland in Australia have examined whether divorce is also associated with obesity, and how these associations are affected by the gender of the divorcing partners. The researchers analyzed the responses of over 17,000 women and men who took part in the US

Health and Retirement Study, conducted by the US National Institutes of Health, and analyzed how obesity rates changed after their divorce. In the US, the researchers found that divorced men and women are 1.7 times more likely to be obese than married men and women. They found that divorced women had a greater risk of obesity than divorced men (2.1 times more likely), but the differences were statistically insignificant.

Meanwhile, the researchers found that divorced men had the highest increase in obesity rates after divorce (1.4 times more likely than married men), while divorced women did not experience a statistically significant increase. The researchers also found that divorced men are significantly more likely to be obese than divorced women. They speculate that this may be because women who divorce are less likely to be

obese before divorce, as they were more likely to have had “higher-quality partners” than men. “The obesity risk of divorced men is higher than that of divorced women, which is consistent with previous research that found that women who divorce are more likely to be divorced than men. This finding is likely to be because divorced women are more likely to be lower-quality partners,” says study author and University of

Queensland associate professor Richard A DeLillo. Divorce and obesity The researchers note that the results are based on data from the US, where there are large differences in divorce rates between men and women. “This analysis cannot tell us whether divorce causes weight gain or weight loss,” the researchers write. “It also
