**The Feasibility and Safety of Blunt Transhiatal Gastroenterostomy in Mice: a Model of Elective Surgery.** There is a need for a non-mammalian model of esophagectomy to aid development of minimally invasive procedures in animals. Blunt transhiatal gastrojejunostomy in mice has been described previously but little is known about the feasibility and safety of this procedure. The aim of this study was to determine the rate of operative mortality and the amount of mortality and morbidity. Feasibility was defined as the ability to perform the procedure using a minimally invasive approach and safety was measured by the number of deaths and the number of complications. Outcomes were compared using Fisher's exact test. There were six mice in the group. One mouse died intraoperatively. Six mice underwent postoperative esophagectomy and were assessed. No mouse died postoperatively. Two mice died from anorexia and debilitation (aggression) and one mouse died from systemic inflammatory response syndrome. Two mice died from other reasons, most likely unrelated to surgery. Postoperative esophagectomy was possible in mice without significant morbidity or mortality.

**Use of magnesium silicate for adsorption of cationic dyes from aqueous solution.** The possible use of magnesium silicate as an adsorbent for decolorization of azo dyes has been explored. Adsorption of methylene blue, methyl orange, crystal violet and basic fuchsin dyes were studied under batch conditions at 20 degrees C. The optimum experimental conditions for adsorption of cationic dyes by magnesium silicate were as follows: contact time 5-60 min, dose 1-10 g/100 ml, initial pH of 4-10 and initial dye concentration of 10-80 mg/100 ml. Adsorption of azo dyes on magnesium sil
