There are many reasons why you might need to get information from your.org domain name in the first place. It's usually associated with a change in admin and/or a new registrar. While most people would think they need to contact the person responsible for the domain to inform them about any changes, in fact, you can simply contact the

registrar on their behalf and get the necessary changes done. Of course, when you contact the registrar you are requesting information about the domain name and the person responsible for the account.

Naturally, the registrar will direct you to the domain owner and not a remote operator of a.org domain.

Frequently asked questions Q: How to get the information about my.org domain? You can simply sign in to

your account via your.org domain and click on the ‘Contact Us’ tab on the top menu. You can leave a message to the admin of your.org domain and follow it up with your personal email. Q: Can I contact the registrar directly to get domain information? Yes, of course. If you sign in to your.org domain name you should be able to contact the registrar directly by following the instructions on their website. Q:

How to get more info about my domain? Some of the online services that offer you.org domain information allow you to do so for free but not all of them do. To get detailed information about your.org domain, you can always use WhoisCL which is a command line tool created to help you get the information you are looking for. Additional information There are many tools you can use to help you

get the information you are looking for about your.org domain name.

This list is not in any way exhaustive and does not include all the features and tools available.

Namecheap is one of the most widely known domain registrars out there. A company with a long history in the domain industry, they have been around for over 10 years and are always striving to make improvements and remain at the

forefront of the domain industry. As one of the oldest and most reliable domain companies online, you can be sure that they have a lot of experience and information to offer you. The fact that they've been around for a very long time means that they have a solid base of satisfied customers, many of whom have been with them for years. One of the best features they offer is the ability to manage multiple domain

What's New In WhoisCL?

WhoisCL - HTTP API Demo

T&C: This free (as in speech) application is totally independent of the WhatIsMyName service and is not in any way linked to it.

WhoisCL is an application meant solely for personal use and does not guarantee results. It's a lightweight command line tool especially created to offer you an alternative

to the online method of obtaining information about a domain. With it you can gather exact data about its registrant and admin along with various tech related info. A command line tool to speed things up There's nothing wrong with using a 'whois' online service to properly identify a website. The disadvantages that exist are more or less user preference related. For one, not having to deal with an

interface means that fewer resources are used by your system while extracting the data. Secondly, the time interval needed to obtain the information is considerably shorter. Using WhoisCL you don't have to waste time opening your browser, accessing the website, typing in the domain name and waiting for the results to come up. Indeed the time it takes may vary between computer system

configurations and Internet connection speed but that is irrelevant since the search is performed on the same machine, meaning that WhoisCL definitely offers faster results. View domain information in a neat list To access information all you have to do is load the application into Command Prompt, type in the domain name and hit the 'Enter' key. In a second, everything about the website that is

available as public information is displayed in an easy to read list. You get details about the registry domain ID, registrar URL, name, email and phone, along with information about the country, organization, street, city, admin name, contact details and much more. Obtain domain information in a few steps All in all, WhoisCL might not be a tool that appeals to the greater majority of people but

if you have to deal with situations where you need to quickly get domain information, it's a very good solution. Background The project has started in the late 90's, in 2000. At the beginning the project was designed to show the IPv4 address of a domain name. This project is called WhoIsIPv4. The project has been designed to work with many of the existing databases and the format used for

output is plain text format. The main files are the database and the command line tool, both for Unix and Windows. PHP Whois

Description PHP Whois is an extension for PHP. It is a fork of the Whois project by Chris Barth. PHP Whois is a command line utility that can be used to lookup the domain name and other contact information of a domain or the IP
