While there have been a variety of proposals for two-stage, triple-deck pyrolysis furnaces, and several have been implemented, the best type of furnace to use is a multiple-bed, two-stage furnace with an afterburner since it will burn off the pyrolysis bottoms which reduce the amount of charge required to operate effectively, increase the capacity of the furnace and reduce the amount of contamination in the finished products. Additionally, because the multiple-bed, two-stage furnace with an afterburner has one or more combustion chambers, the size and operating conditions of a combustion chamber can be controlled and changed to suit the particular requirements of the feedstock being processed. U.S. Pat. No. 3,965,570 to Terhune and No. 4,481,197 to Schoch are two examples of multiple-bed, two-stage furnaces with afterburners having one or more combustion chambers. However, in both of these furnaces, the heat generated by the afterburners is not transferred to the primary combustion chambers and, therefore, the capacity of the primary combustion chambers cannot be increased. Thus, the maximum capacity of the furnace is limited by the capacity of the primary combustion chambers. Similarly, U.S. Pat. No. 4,354,465 to Shoemaker, Jr. and No. 4,551,208 to Love disclose multiple-bed, two-stage furnaces with afterburners in which the heat generated by the afterburners is transferred to the primary combustion chambers, but the primary combustion chambers in Shoemaker, Jr. and Love are too large to allow the furnace to be operated economically. Additionally, Shoemaker, Jr. and Love disclose primary combustion chambers having either a narrow configuration or a rectangular configuration. Furthermore, the primary combustion chambers in Shoemaker, Jr. are located inside the furnace vessel, and, therefore, the primary combustion chambers in Shoemaker, Jr. are always exposed to the feedstock being processed. As a result, Shoemaker, Jr. and Love cannot collect and remove the soot and other impurities which are produced during the processing of the feedstock. These impurities may, of course, cause problems with regard to the operability of the furnace and reduce the quality of the furnace's products.
