Adobe Photoshop CS5. The latest version of Photoshop is the most powerful and complete version to date. It supports a wide range of file formats that will allow you to import, edit, manipulate, and export your digital images from most popular formats. However, Photoshop is more than just a powerful image editor and darkroom. It is also a powerful visual design and multimedia application. If you've made some digital images, now may be a good time to look at using Photoshop as a way to edit and save images, make web graphics, and present them to others. Converting from RAW Images

Converting a camera RAW file is the right thing to do if you want to save your camera's color data. Unfortunately, saving camera RAW files usually involves converting them to a non-RAW format such as JPEG, TIFF, or PSD. The reason for converting a RAW file is that a RAW file format stores the data you get from the camera's sensor, lens, and setting. The RAW image-processing chip that's built into the camera does not convert or change the color data. It only records the data on the sensor's memory chip. However, after you convert the file, the color data is no longer important. You are no longer concerned about how the data was recorded. It is only the color quality that matters. A RAW file will give you the least amount of color processing because the image processing chip stores color information in an uncompressed format. The JPEG image-processing chip converts the image data into a compressed color format. After you convert the file, you can drop the converted RAW file into the trash, or you can save it for safekeeping or the future. Setting up Your Layers Before you start working on your image, you must set up your work on a new, empty Photoshop document. To set up your Photoshop document, do the following: 1. Click the New button at the bottom of the workspace to open a new document and close all of your previously open documents.

The Document Setup area displays the New Document dialog box. (See Figure 7-1.)

****Figure 7-1:**** The New Document dialog box. 2. In the Type of Document box, select the type of document you wish to use. Initially, you have several options to choose from:

- Photoshop Document: Save your images for print.
- Photoshop Web: Save your images

William Atkins (engineer) William John W. Atkins (1924 – February 17, 2001) was an American physicist who studied free-electron lasers (FEL), a special sub-field of laser physics. He developed the first FEL, and was a pioneer in an entirely new area of physics, terahertz radiation. Biography William J. Atkins was born in 1924 in Manhattan, New York. His father was William J. Atkins, Sr., a medical doctor who died of complications from diabetes when he was 35 years old. His mother, the former Grace Hudson, worked as a secretary. William Atkins graduated from The Bronx High School of Science at age 17, and went on to graduate from the City College of New York (CCNY) at age 22 with a Bachelor of Science in Physics. He also earned a master's degree in Electrical Engineering from the City College of New York. In 1947, he received his Ph.D. in Physics from the University of Illinois with a thesis on the production of an electron beam and its applications in the area of terahertz radiation. Atkins then went on to serve as an instructor of Physics at CCNY, and as a member of faculty at University of Illinois. He had a summer program at Oak Ridge National Laboratory from which he returned as a faculty member at the University of Illinois for the 1957–58 academic year. He joined the faculty of the University of California, Los Angeles (UCLA), where he spent the rest of his career. Atkins served as Director of UCLA's Institute of Laser Processes for 18 years, and during that period he succeeded in building a powerful, continuous-wave, free-electron laser (FEL), the first to be built in the United States. He also succeeded in building two types of pulsed, optical free-electron lasers, one of which was the first to use continuous wave operation in the United States. He also won the right to a patent for the first RF-excited free-electron laser which was successfully demonstrated at UCLA. This laser technology made possible the first two free-electron lasers built in the world outside of the Soviet Union. In the mid-1980s, he was one of the first to realize that terahertz radiation could be produced using a FEL. In 1986, Atkins and his students were the first to measure terahertz radiation from a FEL. In 1988
